

ALUMINIUM IN NUMBERS

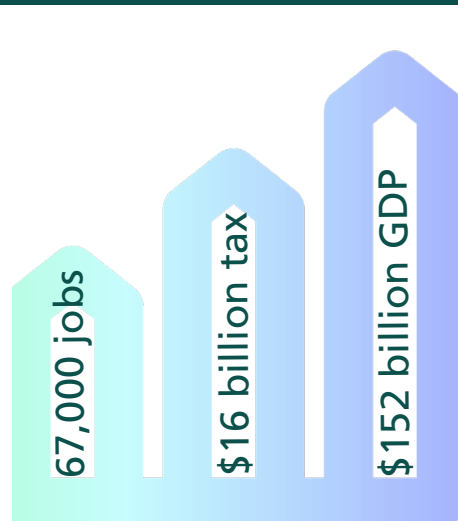

The media is awash with facts and figures about the harmful effects of plastic on the environment. That's why we're shining a light on something more positive — aluminium.

Aluminium makes up about 8% of the earth's crust and is the second most abundant metallic element after silicon.

57,000,000 T
57,000,000 tonnes of aluminium are produced globally.

31,000,000 tonnes is produced in China.

Aluminium contributes over \$152 billion in GDP, \$16 billion in taxes and over 67,000 jobs in the US alone.

Demand has increased by 30% since 2009.

Roughly 20% of aluminium produced is used for packaging.

7 billion aluminium foil containers are produced every year — that's 220 every second.

Annually, over 180,000 tonnes of aluminium packaging are put out to market in the UK.

75% of European production is for packaging and household foil.

Recycling aluminium saves 95% of the energy needed to make raw materials.

Recycling 1 tonne of aluminium saves 9 tonnes of CO2 emissions.

1 tonne of Co2 is equivalent to driving a car 2,800 miles.

The aluminium industry has reduced its carbon footprint by nearly 40% since 1995.

Advanta has 65 presses in its UK manufacturing facility and can produce up to 4.2 tonnes of aluminium products a day.

Advanta has 700 products in its portfolio – the largest in the industry.

Advanta produces 2.3 billion products each year, using up to 15,000 tonnes of aluminium.
